

Below is the complete **technical specification** for the Vendor Discount Code module, written for implementation by the development team.

Vendor Discount Code Module – Technical Specification

1. Objective

Create a Discount Code Management section inside each Game page in the Vendor Panel that:

- Allows vendors to create and manage discount codes in a controlled manner.
- Transparently shows discount costs.
- Reduces financial misuse and accounting errors.
- Clearly displays wallet debt status and negative limit.
- Ensures financial deduction happens **only when the order reaches the final confirmed state**, which is defined as:

Order status = “Wallet” (This is the confirmed/settled state after the game is held successfully).

2. Placement in Vendor Panel

- The module must exist at the **Game level**, not at brand level.
- Each game page must include a button similar to “Session Settings”:

Button Name: “Manage Discount Codes”

3. Discount Code List Page

Table Columns

- Discount Code
- Discount Percentage
- Validity Period (Start – End)
- Minimum Required Players
- Confirmed Uses / Total Usage Limit
- Total Confirmed Discount Amount

- Status (Active / Expired / Suspended)
 - Actions
-

Status Definitions

Active

- Current date within validity period
- Not manually suspended
- Not suspended due to ownership change
- Wallet debt not exceeding limit

Expired

- End date passed

Suspended

Triggered by:

- Ownership change
 - Manual deactivation
 - Wallet debt exceeding allowed negative threshold
-

Row Actions

- View Details
- Deactivate
- Extend End Date (only if there are no confirmed usages)

After the first confirmed usage:

- Editing discount percentage is forbidden.
- Editing usage rules is forbidden.
- The Edit button must be disabled.
- Show message:

“After the first confirmed usage, modifying discount rules is not allowed.”

4. Create Discount Code Form

Fields

1. Discount Code (manual input)
 2. Discount Percentage (selectable from 0% to 20%, 10 selectable options)
 3. Total Usage Limit
 4. Per User Usage Limit
 5. Start Date
 6. End Date
 7. Minimum Required Players
-

Validations

- End date must be after start date.
 - Percentage must be within allowed range.
 - Total usage limit must be $\geq$ per-user limit.
 - Minimum required players must not exceed game capacity.
 - Code must be unique per game.
-

Pre-Submit Warning Message

Display confirmation box:

“The discount amount will be deducted from your wallet only after the game is successfully held and the order status changes to ‘Wallet’. If the reservation is cancelled before the event, no amount will be deducted.”

5. Discount Code Details Page

Contains two sections:

A) Usage List

Columns

- Reservation Code
 - User Name
 - Number of Players
 - Discount Amount
 - Usage Status
 - Date
-

Usage Status Definitions

Pending Confirmation

Reservation created but order status has not yet reached “Wallet”.

Confirmed

Game held successfully and order status changed to “Wallet”.

Discount amount deducted from vendor wallet.

Cancelled

Reservation cancelled before confirmation.

No wallet deduction.

B) Financial Summary Section

Display:

- Total Confirmed Discount Amount
 - Total Confirmed Usage Count
 - Simple usage trend chart over time
-

6. Wallet Behavior on Order Confirmation

Critical Rule

Discount deduction from vendor wallet must happen ONLY when:

Order status becomes “Wallet”.

This status represents a confirmed and successfully held order.

Negative Wallet Policy

Allowed negative threshold: -٢,٠٠٠,٠٠٠ Toman

Scenario A – Within Allowed Negative Range

If wallet balance after deduction is $\geq$ -٢,٠٠٠,٠٠٠:

- Deduction proceeds.
- Usage becomes Confirmed.
- Wallet transaction recorded.

Scenario B – Exceeding Allowed Negative Threshold

If wallet balance would go below -٢,٠٠٠,٠٠٠:

- All discount codes for that game must be automatically Suspended.
- Future discount applications must be blocked.
- SMS and in-panel notification sent to vendor.
- Show message:

“Due to exceeding the allowed debt limit, your discount codes have been suspended. Please recharge your wallet.”

Confirmed usages remain valid.

Pending usages are not confirmed until wallet is recharged.

٧. Ownership Change Behavior

When game ownership changes:

١. All discount codes → set to Suspended.
٢. Show message on code page:

“This discount code has been disabled due to game ownership change.”

٣. Confirmed usages remain unchanged (financial trace preserved).
٤. Pending usages → automatically set to Cancelled.
٥. No new usage allowed.

^ . Post-First-Confirmation Restrictions

After the first Confirmed usage:

The following fields become locked:

- Discount Percentage
- Minimum Required Players
- Per User Limit
- Total Usage Limit

Allowed actions:

- Deactivate
- Extend End Date

No other modifications permitted.

^ . Usage Counting Logic

All limits must be calculated based only on:

Confirmed usages (orders with status “Wallet”).

Pending or Cancelled usages must NOT count toward usage limits.

^^ . Wallet Ledger Requirements

Every confirmed deduction must create a wallet transaction record:

- Type: Discount Subsidy
- Reference: Discount Usage ID
- Reservation ID
- Amount (negative)
- Timestamp
- Balance before / after

If a confirmed order later requires reversal (edge cases):

- A reverse wallet transaction must be created.
 - Usage status → Reversed.
-

11. Discount Application Rules During Checkout

At reservation time:

The system must validate:

- Code is Active.
- Within validity period.
- Total confirmed usage < total limit.
- User confirmed usage < per-user limit.
- Player count >= minimum required.
- Game ownership matches discount vendor.

If any rule fails, show clear error message.

12. Version 1 Scope Limitation

For initial release:

- Percentage-based discount only.
- Single game only.
- No stacking with other discounts.
- No fixed-amount discount.
- No tiered discount logic.

Architecture must allow future extensibility.

End of Specification

If needed, the next step can be:

- Database schema definition
- State transition diagram

- Edge-case scenario mapping
- API contract documentation
